y the experiment. Prof. Agassiz continued that in in 1840 he be-

sake of study. He raised them in his wash basin in his bed-room, where he raised frout, white-fish and a number of less valuable fish without

taking much care.

The manner of constructing a trough was il-

lostrated; and the sistement made that the fish in passing over dams did not go in the main current, but at some distance from the shore.

They found places where the current was least

and the fewest obstructions were to be overcome. The cost of a suitable trough sufficient for a fall of not near than 10 or 15 feet, would be,

perhaps, \$150. If the fish-way is so steep that

the current will be very difficult to overcome, cross-bers should be arranged on the sides to

cross-cars smean of the water and to allow op-portunity for the fich running up the stream to rest themselves. By this means fish might pass
